

Python Variables

Variables

↳ A variable is used to store information or data

→ A variable is a storage container

- In python we read code from left to right

`name = "Rofhiwa"`
↓
Variable

- In python we execute code from top to bottom
↓
Value

`print()` - Allows us to display

`print(name)`
↓
Rofhiwa

`print(x)`
↓
4

~~car = "mbali"~~

N.B# When you assign a variable you need to make it to be descriptive

car = "Suzuki"

- Variables must be explainable

Rules for naming variables

① Variable names must start with a letter or an underscore character

name = "Rafhiwa"

— surname = "Nemukula"

name_surname = "Rafhiwa Nemukula"

- No space in between the variable, we separate words by underscore
- We cannot start a variable name with a number
- we cannot start a variable name with any other symbol besides the underscore
