

Data Types

Text Type — str — "Mvuko"
"Welcome to bright learn"

Numeric Types — int — Age = 26
— float — price = 9.20
— complex — imaginary number
 $i = \sqrt{-1}$

Sequence Types — List ["Toyota", "BMW", "Haval"]
— Tuple ("John", "Jane", "Roptiwa")
— Range Range(0, 10)

Mapping Type — Dictionary
Key
Value
— { Name: "Doe", Age: 26 }
key value

type.C)

print (type (names))
str
int
float

Boolean — yes / no
True / False.

x = true
X = True

x = list ("Thabo", "Tyla", "Beyonce")

x = dict (name="John", Age=26)

x = str (3)

Lists

- Store multiples items in a single variable
- ↓ Ordered - order of items will not change
- Changeable - Add items, Remove items.
- Allow duplicates - Can store same value

```
listNames = ["John", "Lisa", "Thabo", "John"]  
listAges = [26, 35, 40, 24]  
listNames2 = ["Ketro", "Verato", "Rofhiwa"]  
append() - listName.append("Sally")  
count() - listName.count()  
extend() - listName.extend(listNames2)  
Remove() - listName.remove("Rofhiwa")  
Reverse() - listName.reverse()
```

Tuple
